Python Study Notes

A variable is a name that refers to an object in Python.

A list is an ordered mutable collection that can contain duplicate items.

A tuple is an ordered immutable sequence that can contain duplicate items.

A dictionary is a mutable mapping from unique hashable keys to values.

A set is an unordered collection of distinct hashable elements.

A function is a reusable block of code defined with the def keyword.

The return statement sends a result from a function to its caller.

A parameter is a named input in a function definition.

An argument is a value supplied when a function is called.

A class is a definition used to create objects with data and behavior.

An instance is an individual object created from a class.

The len function returns the number of items in an object.

The range function produces an immutable sequence of integers.

A for loop iterates over the elements of an iterable object.

A while loop repeats a block of code while its condition is true.

A try statement is used to handle exceptions with except clauses.

A list comprehension creates a list from an iterable using a compact expression.

The with statement manages a context and runs its cleanup when the block exits.
